COMMENTS: JASON: This engine has a serious coolant leak. Coolant is apparent in the potassium, silicon, and sodium levels, and the actual presence of water (12.0% of the sample). Water likely raised the viscosity and caused rapid oxidation since insolubles are excessive. Also note the flashpoint is low enough to show excess fuel in the oil. Iron and copper are elevated after just 400 miles of oil use, showing poor wear at steel and brass/bronze parts. For reference, averages for comparison are based on a 5,500-mile run. Metals might improve once contamination is no longer a problem.
