

Mercedes-Benz

Controller Area Network CAN

P00.19-2321-71

These technical training materials are current as of the date noted on the materials, and may be revised or updated without notice. Always check for revised or updated information.

To help avoid personal injury to you or others, and to avoid damage to the vehicle on which you are working, you must always refer to the latest Mercedes-Benz Technical Publication and follow all pertinent instructions when testing, diagnosing or making repair. Illustrations and descriptions in this training reference are based on preliminary information and may not correspond to the final US version vehicles. Refer to the official introduction manual and WIS when available.

Objectives

- Explain advantages of CAN networks
- Explain how CAN networks operate
- Describe location of CAN connectors
- Explain CAN diagnosis techniques
- Provide reference information on other models
(reference section at back of handout)

What is a CAN System?

A CAN system is:

- A digital communication link between multiple Electronic Control Modules (ECM)
- A 2 wire, bi-directional communication link with data transmitted according to priority
- Message specific addressing

Advantages

- Cost
- Improved immunity to electrical interference
- Fewer connectors
- Fewer pins on control modules
- Weight savings
- Fewer sensors
- Improved diagnosis facilities
- Rapid transmission rates

Types of CAN Communication

Mercedes-Benz uses several CAN networks. Depending on model and year the following may be used.

CAN C - Engine CAN (*also known as chassis CAN*)

Fast communication speeds 125 kbps or 500 kbps

CAN B - Interior CAN (*also known as body CAN*)

Communication speed 83 kbps

Information from CAN C can be sent to control modules on the CAN B or vice versa via the Electronic Ignition Switch (EIS). The EIS is the only control module* that can transfer the messages and is known as the gateway.

Without CAN

Coolant sensor 1

Coolant sensor 2

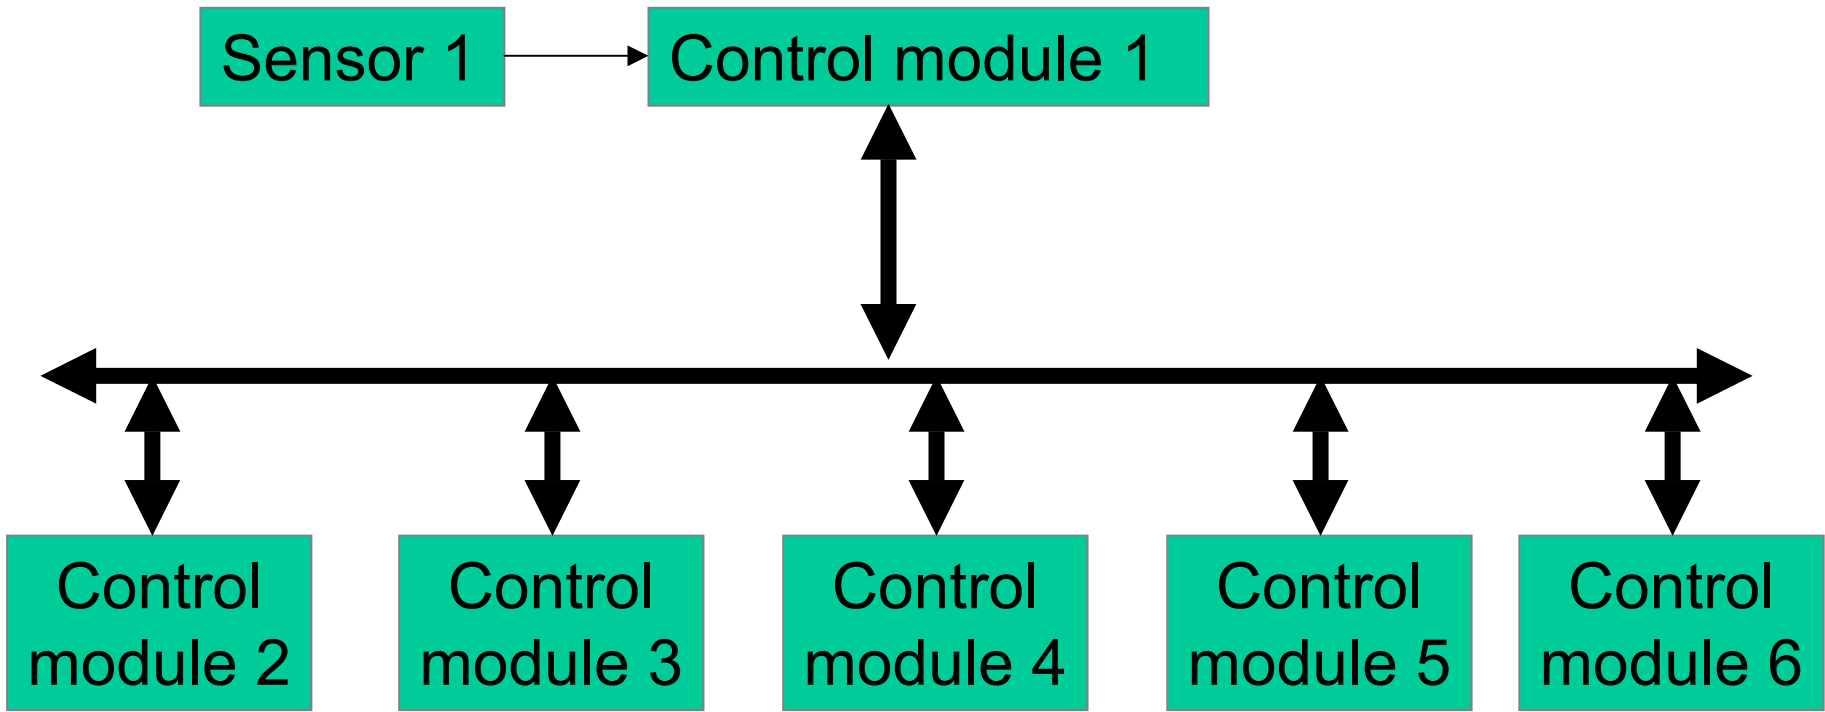

Coolant sensor 3

Control module 1
(e.g. fuel system)

Control module 2
(e.g. climate control)

Control module 3
(e.g. ignition)

CAN Bus

CAN B Example

Controlling R.R. window from L.F. door

CAN High & Low

The CAN wiring consist of 2 wires called CAN High (CAN H) and CAN Low (CAN L).

All the control modules are connected in a parallel circuit using either Z splices or plug connector blocks (X30/_).

For the remainder of this presentation and shop modules, we will concentrate on the CAN B network as used in W203 / W220).

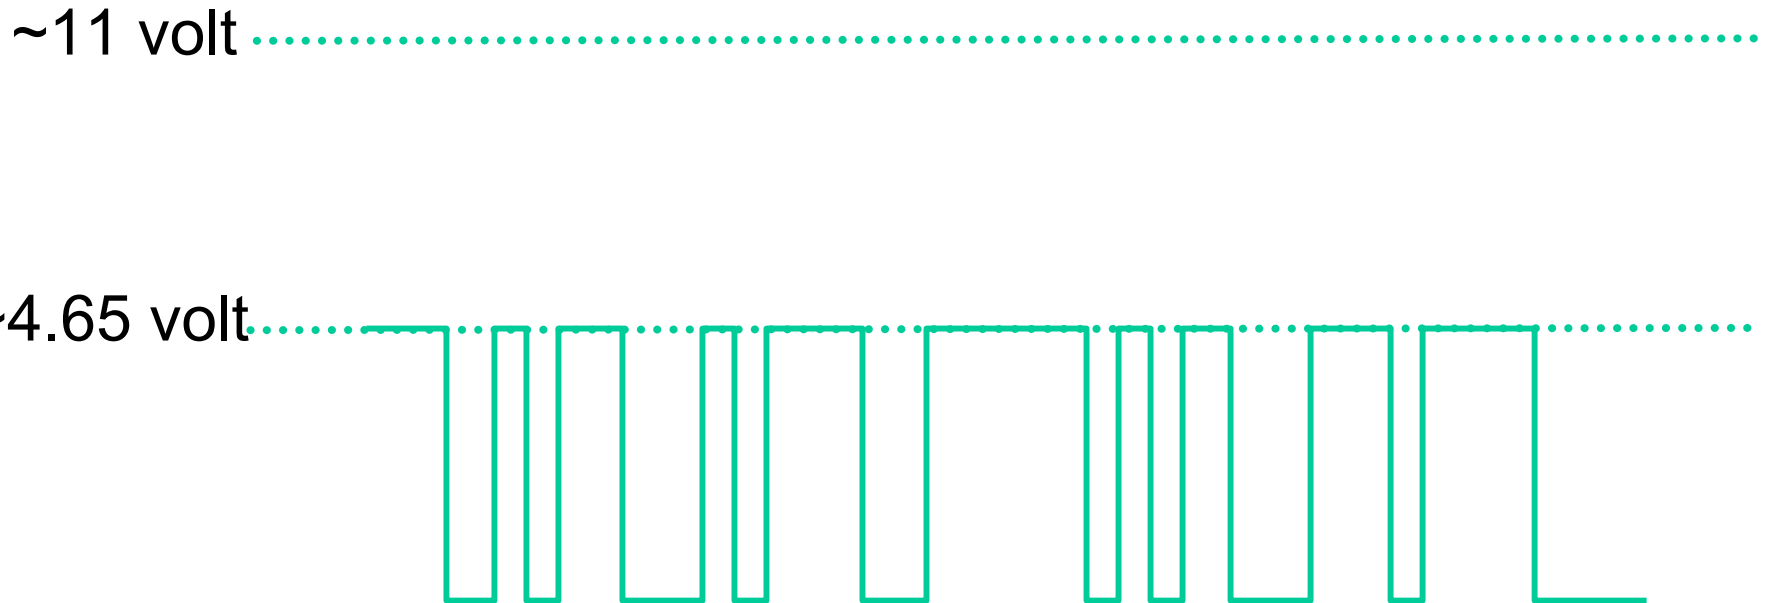

CAN H

- CAN-H has a voltage of approx. 0.025 volts when dormant
- Rises to base voltage of 0.65 volts when communicating
- Data seen as voltage levels going “high”

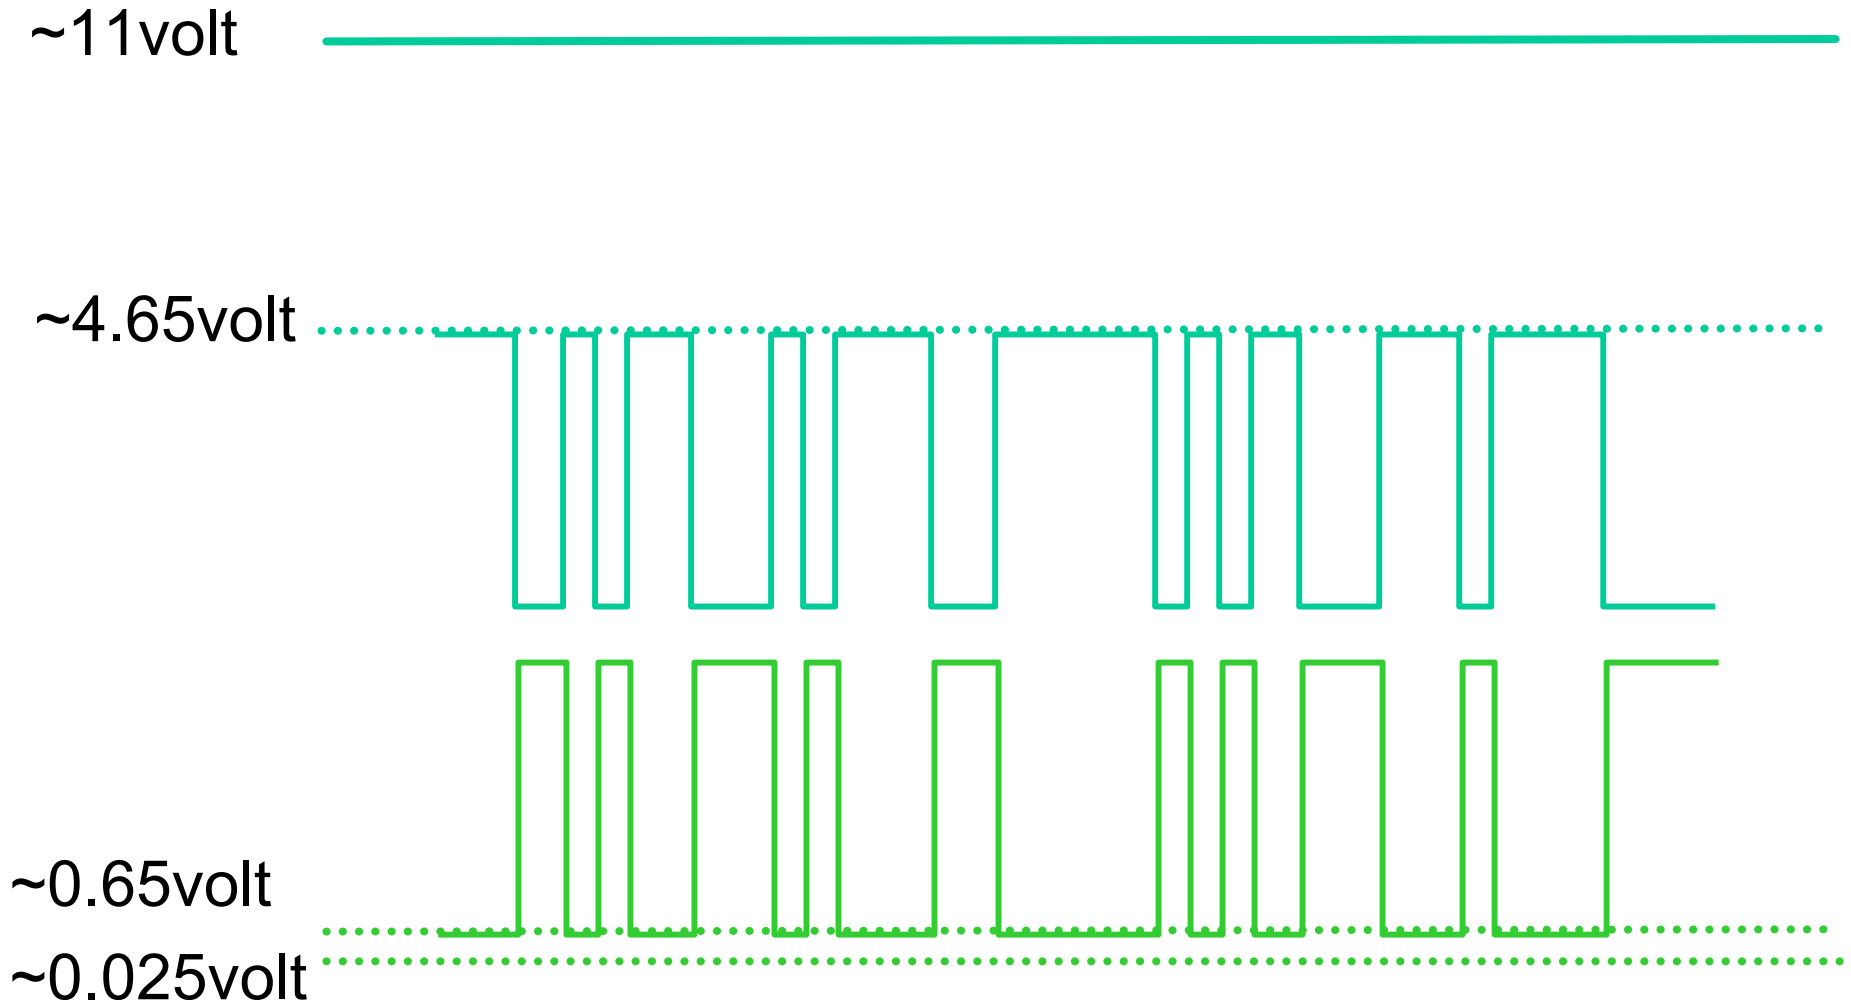

CAN L

- CAN-L has a voltage of 11.0 volts dormant
- Base voltage drops to 4.65 volts when active
- Data seen as voltage level going “low”

CAN B High & Low

Safety Concept

CAN L still communicates (single line operation)

CAN H shorted to ground, cannot communicate

Wake-up Signal

Door switch

Rear SAM

EIS

N70 (Overhead Control Panel)

- EIS is the master of the CAN
- EIS wakes up the control modules on the CAN

Tools For Diagnosing CAN B

- Ohm meter
- Volt meter
- Oscilloscope
- CAN B test harness
- SDS
- WIS

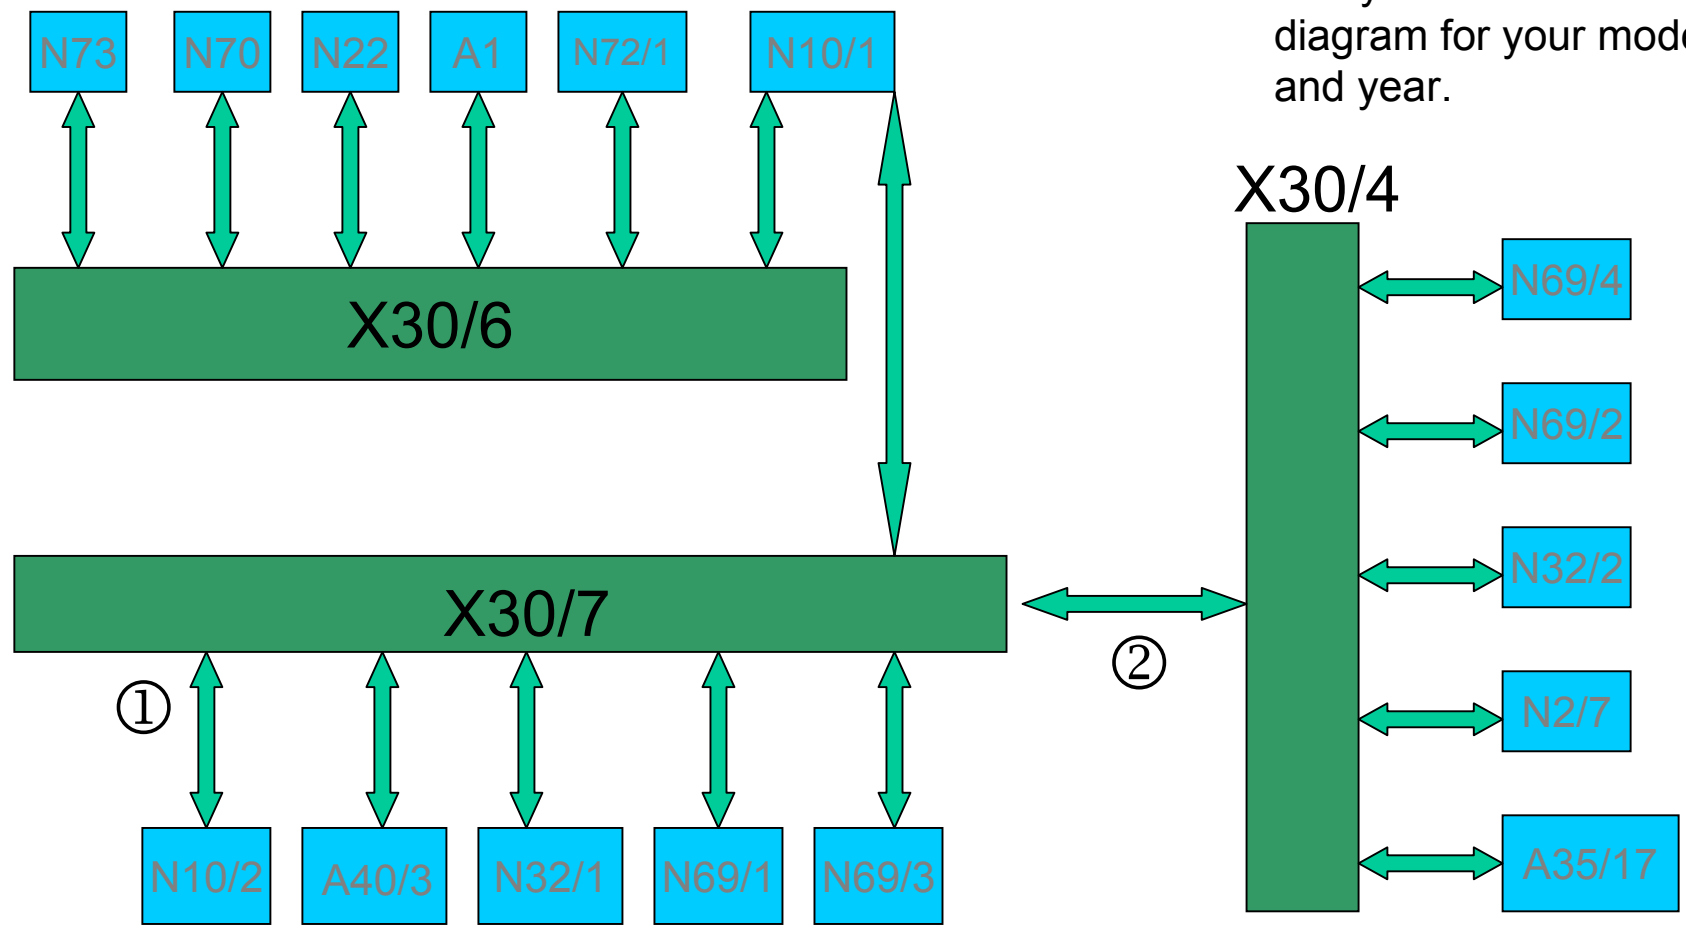

Note: The red lead is not always the CAN H

W203 CAN B (MY 2001)

via N10/1

Note: Always refer to the wiring diagram for your model and year.

- A35/17 - TELE AID
- N32/2 - ESA-FR

CAN B Malfunctions

- Shorted CAN B
- Constantly active CAN B
- Incorrect version coding

Shorted CAN B

When both the High and Low CAN B are shorted to ground or positive no communication is possible between control units.

This can happen if:

- a. Control unit shorted
- b. Wiring harness shorted

How could we determine if the CAN B is shorted?

- a. Monitor CAN B voltage out of EIS
- b. Monitor CAN B oscilloscope pattern out of EIS
- c. Monitor the DAS (SDS)

Constantly Active CAN B

CAN B needs to go into a dormant state when the ignition switch is in the 0 position. EIS is the control unit in charge of activation and deactivation of the CAN B.

If a control unit in the CAN B keeps sending a signal the EIS will not request the CAN B to go into a dormant state.

How can we determine if the CAN B has not gone into a dormant state?

- a. Monitor CAN B activity with an oscilloscope
- b. Monitor CAN B voltage

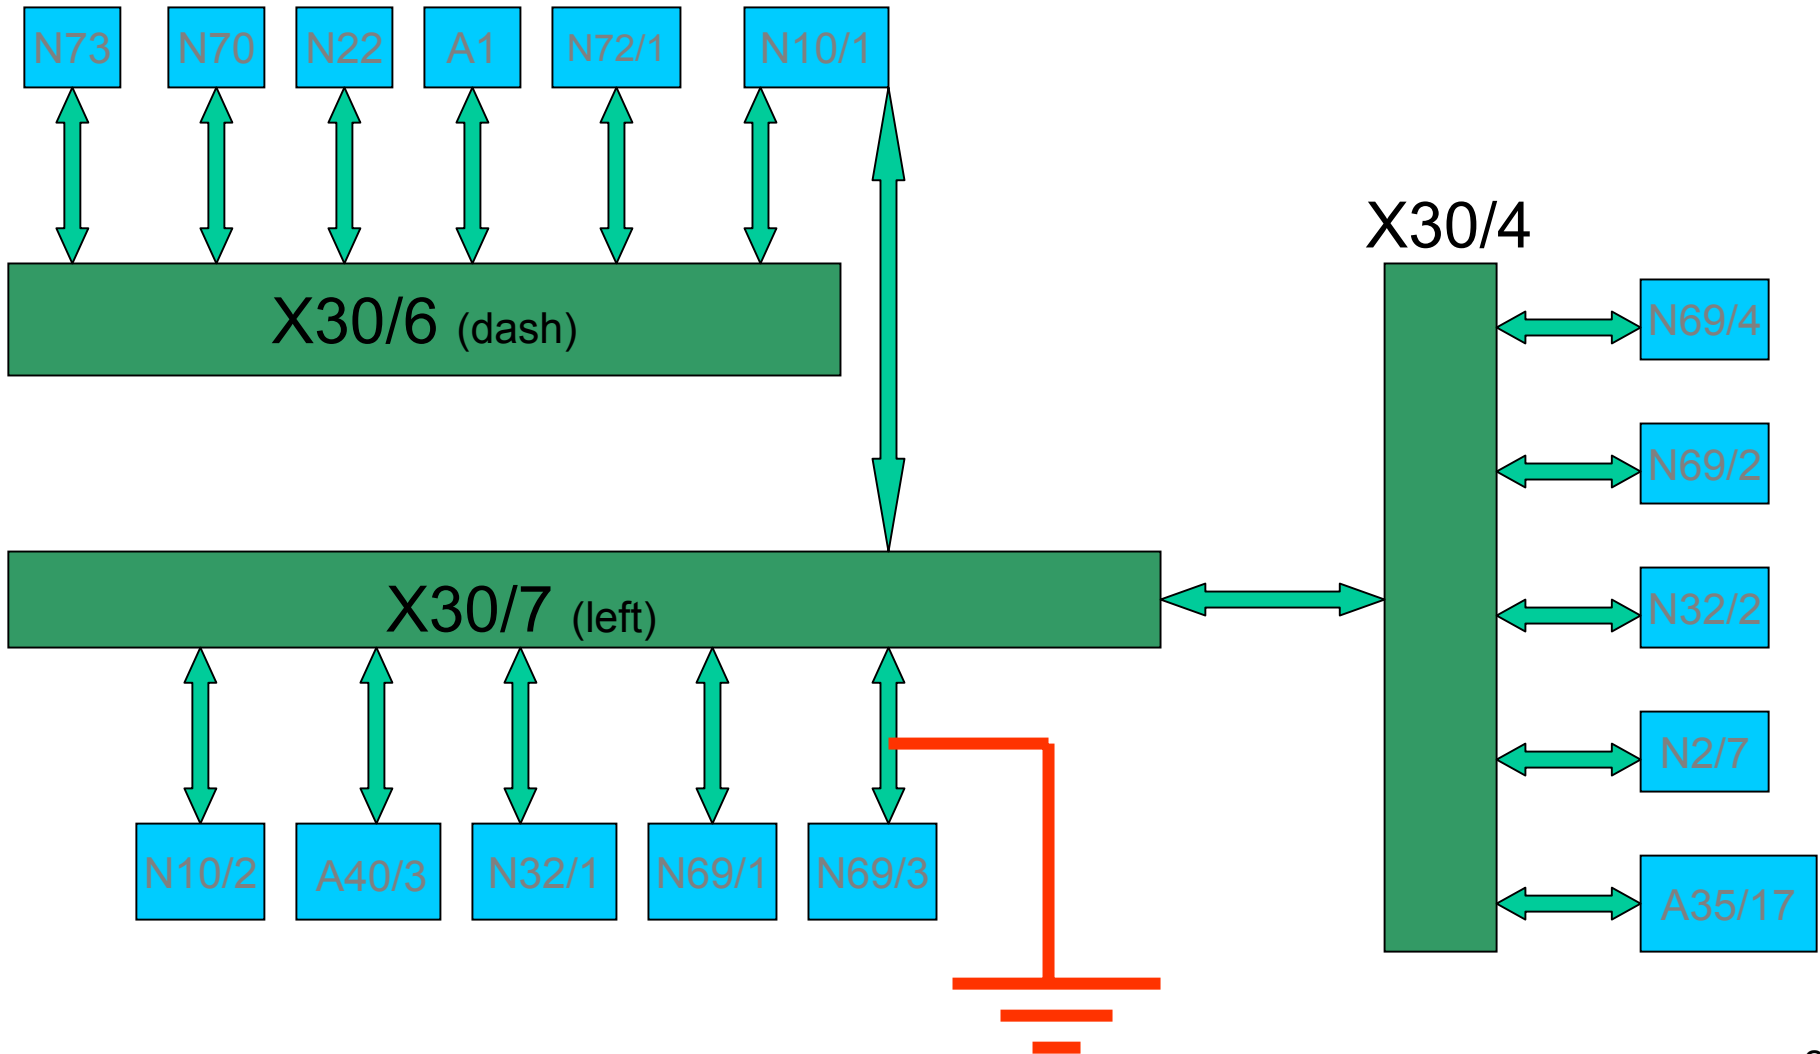

Diagnostic Exercise For CAN B

The following diagnostic exercise involves a W203 with a shorted control unit.

W211 CAN D

- Is the diagnostic link between Central Gateway Module (N93), Communications Platform (N112) and SDS / DAS
- CAN D voltage
 - High = 2.5v
 - Low = 2.5v
- CAN D voltage awake
 - High = activity to 3.5v
 - Low = activity to 1.5v
- All modules on CAN B are diagnosed by SDS / DAS through CAN D
